

The Reasons of presence street children have been mentioned

Poverty, parents' deaths, conflicts and violence are the source of children to wander and work in the markets

Dodoma: The government has mentioned the reasons why many children appear carrying loads in the market

Deputy Minister of State in the President's Office Local Government, Joseph Kandege has mentioned today that these factors are extreme poverty in some households, losing parents to HIV disease, marital conflict and violence against children

Responding to the question of MP Special Seats (CUF), Alien Traditional Kadika, Kandege said children are protected by the laws of child number 21.

In his question, Kadika wanted to know the government has a strategy to eliminate the problem of children who provide care burden and given the low wages in the areas of marketing, including Dodoma.

For his part, Deputy Minister of Health, Dr Faustin Ndugulile said the census that has been found has seen more than 600 children on the street but said he does not know which city is leading to numbers.

And the Speaker of Parliament, Job Ndugai said the man was found in Dodoma has entrusted the child load the streets and living in difficult circumstances will be fined Sh50,000.

patients have increased in Tanzania

In 2010 the World Health Organization (WHO) warned in 2030 the world's 52 million people will die from the disease exposure and lifestyle (NCDs)

Non-communicable diseases are diabetes, cancer, heart problems and affect the respiratory system. Some are the kidneys and the liver that increases the day after day.

Although Tanzania started a campaign against the disease three years ago, there is still no great success since these efforts are dependent on people's willingness to participate in order to obtain protection information.

However, experts who spoke to The Citizen have warned daily habits or lifestyle to be the source of many non-communicable diseases.

Health professionals confirm that food type is the source of some non-communicable diseases and according to WHO 30% of deaths in the country are caused by this disease

Chairman of the Confederation Association (Tancda), Professor Andrew Swai says that when you eat too much sugar, it enters the stomach and meets the air and then makes a force that burns some of the body's organs.

Fortunately, he says non-communicable diseases can be prevented because they are caused by the lifestyle, but people need food to gain strength.

That is the practice since birth so sugar should be found in the body so that the brain, the liver, the kidney, the lungs are working, but warns that it is harmful," he says.

Recognizing this, he suggests that sugar should enter the body as little as it is needed to identify the effects of excessive amounts of sugar and fire used to prepare the meat to burn... if the meat is burning. The more sugar suggests the body is why the diabetes opens the eyes, nerves, kidneys and blood vessels.

Professor Swai says the body is not able to stop the sugar that meets the air must make it stronger. "If you start eating too much sugar

from childhood, when you reach the age of 40 the extra energy produced by sugar begins to burn the body's organs so you get diabetes.”

To reduce the possibility of getting into this situation, he advises fruit rather than crushing or to get the juice.

The carbohydrates get into the body and have sugar, which comes into the stomach and is covered by a special system, but we are wrong when we break it.

Thickness excess

Public health specialist, Dr Ali locust says there are some indicators in the body if you judge then realized it identify overweight.

To find out if you have symptoms of obesity that has passed, says a man with more than 40 inches through a loop around the waist, has a woman with a more than 35 inches.

However, this doctor says many people still do not know the correct way to lose weight. He advises to reduce fat intake of fat as they should not exceed 10 percent so that the body can function properly.

A study conducted in 2012 revealed many Tanzanians are at risk of non-communicable diseases at different rates. With an overweight percentage is 34.4 percent, alcoholic drinks 29.3 percent, with multiple sclerosis in the body is 26 percent and consumers 15 percent.

If so, medical costs are increasing daily. According to the Lancet health newsletter, by 2030, diabetes treatment costs will increase to \$ 16.2 billion (about Sh40 trillion) for Tanzania, Kenya and Ethiopia to increase \$ 3.8 billion compared to 2015 .
